

when subjected to vibrations having a frequency between 20 and 30 Hertz and an amplitude of 0.76 mm (0.03 inch) in a direction at an angle of 30 to 45 degrees with the base of the automatic-alarm-signal keying device.

[51 FR 31213, Sept. 2, 1986, as amended at 58 FR 44952, Aug. 25, 1993]

**§ 80.263 Common requirements for survival craft radio equipment.**

In addition to the requirements set forth in §§ 80.265 and 80.267, survival craft radio equipment must comply with the following:

(a) The radio equipment must be operable without tools.

(b) Each equipment must be provided with an instruction manual covering the design, installation, operation, and maintenance of the equipment.

(c) Simple instructions for the operation of the equipment must be prominently and permanently attached to it. These instructions must include information about the erection of the antenna(s), and automatic and manual transmission of the international distress and alarm signals on 500 kHz.

(d) An artificial antenna for test purposes must be provided.

(e) The survival craft radio transmitter must meet the following:

(1) Must be pretuned to the required frequencies. The operating frequencies must be maintained within the prescribed tolerances under varying voltages, antenna circuit characteristics, and other normal conditions of adjustment, and shock or vibration. The frequency control circuit adjustments must not be readily available to the person using the transmitter;

(2) Antenna tuning controls must be provided on the operating panel. An initial adjustment of these controls must resonate the antenna circuit at each required operating radio frequency. Resonance must be maintained without further adjustment of the controls during a normal operating period of the transmitter;

(3) The front panel must contain controls for manual operation on 500 kHz, manual operation on 8364 kHz, and automatic operation alternately on these two frequencies. Not more than one manual switch adjustment must be necessary to transmit automatically.

For manual radiotelegraphy the transmitter and receiver, including their controls, must be arranged so that they can be operated from the same operating position and the time necessary to change from transmission to reception and vice versa must not exceed two seconds; and

(4) In automatic operation the radio must:

(i) On 500 kHz transmit the international radiotelegraph alarm signal followed by the international radiotelegraph distress signal, the latter to be transmitted in one or more separate groups, each group consisting of three separate distress signals;

(ii) On 8364 kHz transmit the international radiotelegraph distress signal in one or more separate groups, each group consisting of three separate distress signals; this group or these groups to be followed by a continuous long dash of not less than 30 seconds in duration;

(iii) Transmit the specified signals by automatically changing the operating frequency of the transmitter from 500 kHz to 8364 kHz and vice versa with a transfer time interval not to exceed one second;

(iv) Completely de-energize the receiver during operation of the transmitter;

(v) Be capable of testing the required automatic keying arrangement without the generation of radio frequency energy; and

(vi) For automatic transmission of the international radiotelegraph distress signal, not exceed 16 words per minute or be less than 8 words per minute. The alarm signal dashes must have a duration within the limits of 3.8 to 4.2 seconds, and the spaces between each of the 12 dashes constituting a series must have a duration within the limits of 0.8 to 1.2 seconds.

(f) Survival craft radio receivers must meet the following requirements:

(1) The receiver must be capable of receiving A2A or H2A emission over the 492-508 kHz band without manual tuning and when manually tuned must be capable of receiving A1A and A2A or H2A and J2A emission on any frequency in the 8320-8745 kHz band;

(2) The selectivity of the receiver preceeding the final detector must be

**§ 80.265**

**47 CFR Ch. I (10–1–00 Edition)**

flat within 6 dB over the band 492 to 508 kHz;

(3) The audio frequency response of the receiver must be flat within 6 dB over the range of frequencies between 400 and 1400 Hertz; and

(4) The receiver must be equipped with only one manually operated volume control.

(g) The artificial antenna must meet the following requirements:

(1) Provide a reliable test load for the transmitter at the frequencies 500 kHz and 8364 kHz of approximately the same electrical characteristics as the single wire or collapsible rod antenna required by this section;

(2) Be housed in a single container and provided with terminals. If more than two terminals are provided on the artificial antenna, all the terminals must be labelled; and

(3) Be prominently labelled "FOR TEST USE ONLY".

**§ 80.265 Requirements for survival craft portable radio equipment.**

(a) Survival craft portable radio equipment must be provided as a single portable buoyant unit consisting of a transmitter, receiver including headphones, power supply, grounding system, antenna system and line for lowering the apparatus. Each totally enclosed lifeboat must comply with the additional equipment requirements specified in this section:

(1) The radio must float in sea water and withstand a drop into sea water in various positions from a height of 6 meters (20 feet), without requiring repair or adjustment other than normal antenna tuning. The operating controls, indicating devices and instru-

ments, including the headphones, must be protected against physical damage and from prolonged exposure to the weather. The radio must withstand submersion in sea water so that no part is less than 5 centimeters (2 inches) below the surface of the water for two hours without leaking;

(2) The radio must be fitted with handles or grips. It must be carryable by either one or two persons;

(3) The radio must be designed to attach to a lifeboat thwart by lashing or other acceptable means;

(4) The radio, exclusive of the line for lowering, must not weigh more than 27 kilograms (60 pounds). A radio for use in a totally enclosed lifeboat must not weigh more than 18 kilograms (40 pounds);

(5) The line for lowering must consist of not less than 12 meters (40 feet) of 9 thread manila or sisal rope, or the equivalent thereof, which must be securely attached to the radio at all times;

(6) All removable components necessary for the proper operation of the radio must be attached to this equipment;

(7) Each radio must have a durable removable plate showing clearly the survival craft radio call sign in letters and digits and in characters of the Morse code; and

(8) The maximum overall dimensions of the radio to be used in totally enclosed lifeboats including accessories must not exceed 35 by 40 by 50 centimeters (14 by 16 by 20 inches).

(b)(1) Portable survival craft radio transmitters must meet the following requirements:

Operating frequency (kHz)	Frequency tolerance		Type of emission	Modulation percentage (average of modulation percentage of positive and negative peaks)	Modulation frequency	Average power output into specified artificial antenna	Artificial antenna
	Parts <sup>1</sup> in 10 <sup>6</sup>	Hz <sup>2</sup>					
500 .....	5,000	20	A2A and A2B or H2A and H2B.	Not less than 70	Not less than 450 nor greater than 1350 Hertz.	Not less than 1.7 watts.	10 ohm resistance, 75 picofarads capacitance.
500 .....	5,000	20	.....do .....	.....do .....	.....do .....	Not less than 2 watts <sup>3</sup> .	15 ohms resistance, 100 picofarads capacitance.
8364 .....	200	50	A2A and A3N or H2A and H3N.	.....do .....	.....do .....	Not less than 4 watts.	40 ohms resistance.

<sup>1</sup> For equipment approved before November 30, 1977.

<sup>2</sup> For equipment approved after November 29, 1977.
